

Code documentation

Structure

- Config (**IMPORTANT**)
- API - *all data managers, API, models*
- Flows - *all app screens/flows*
- Views - *basic views*

SCROLL DOWN TO THE 'Things To Change in the Code' SECTION, if you want INSTRUCTIONS on how to change the Bundle IDs and App Group IDs.

How does it work:

DashboardContentView is the main view that holds each tab. So this view doesn't have much, except the title and the container for each tab as well as showing the AdMob ads on tab switch. Each tab has it's own view.

Flows -> Tabs folder

This folder has all the views for every single tab. If you need to make any changes, you can see each of these tabs.

The app has 3 main tabs: Home/Movies (first tab), Must Watch and Watched.

In this folder you will see all 3 of them. Last 2 tabs are very similar.

AppConfig is the file that you may recognize from all Apps4World templates, here you can find some helpful configurations that you can change if needed.

NOTE: Make sure you change the API Key, otherwise the app won't work:

```
static let tmdbAPIKey = "ADD_YOUR_API_KEY_HERE"
```

To create your own API key, please follow this guide here:

<https://developers.themoviedb.org/3/getting-started/introduction>

Must Watch and Watch

These 2 types or status for a movie, works by saving the details for a Movie. We're saving the movie details to the UserDefaults, so whenever the user deletes the app, all this data will be deleted as well.

NEW IDEAS FOR YOU

If you see the API link above, this website provide a large variety of things like TV Shows, advanced search/filtering and so much more that you can do and improve this app with.

TO CHANGE THE ADMOB IDS SEE THE OTHER PDF FILE.

Good luck with your next app!
